TITLE: Modeling of optical organs and of perception

SOURCE: Ref. zh. Biologiya, Abs. 12R313

REF SOURCE: Sb. Probl. bioniki. M., Mir, 1965, 84

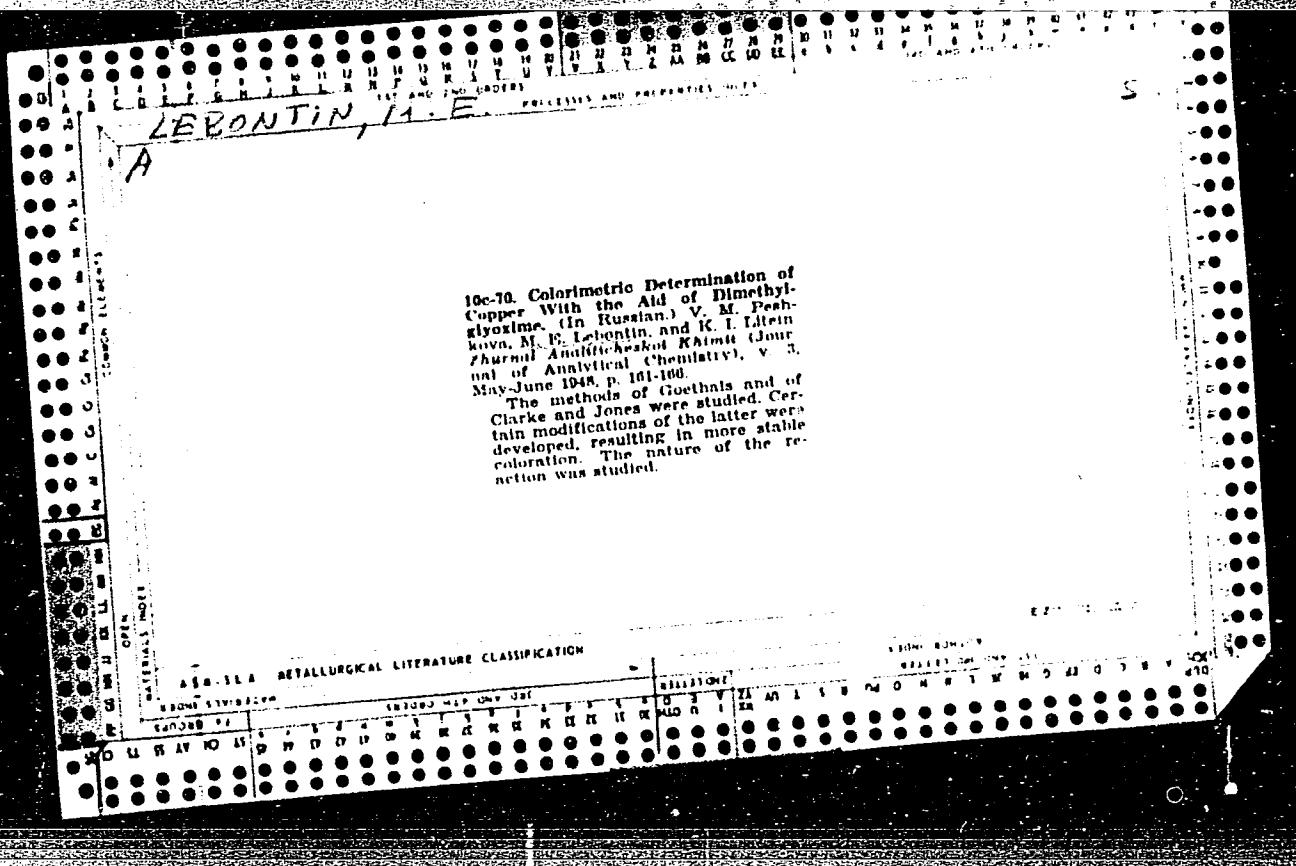

TOPIC TAGS: biology, vision, eye, optic model, anatomic model, perception

ABSTRACT: A modernized model of an artificial retina is described. The model contains three layers of active electronic elements working in parallel and two synaptic fields interconnecting these layers. All the conversions in the new model are produced by the cutoff elements. This model represents an effort to approach the process of reproducing actual receptive fields and those temporary relationships which are introduced in the work of Maturan ("J. Gen. Physiol.", 1960, 43, 129). The analog between these conversions and those occurring in the human mind in the course of classifying and generalizing in the process of visual perception is analyzed. V. Antonov [Translation of abstract]

TITLE: Introduction of organoelemental compounds in polystyrene 15

SOURCE: Atomnaya energiya, v. 17, no. 6, 1964, 497-500

TOPIC TAGS: polystyrene, organoelemental compound, copolymerization, shielding material, luminescent additive, scintillation counter

ABSTRACT: Materials for γ -radiation and for neutron shielding and scintillation counters have been synthesized by high-temperature copolymerization of styrene with tetraphenyl lead, diphenylmercury, 7 tetraphenyltin, triphenylarsen, triphenylbismuth, or diphenylselenium. Scintillators were prepared by introduction into styrene of such luminescent additives as terphenyl. The copolymerization conditions of materials containing 12% Pb, 19% Bi, 33% Hg, 12% As, 11% Sn, or 10% Se are described in detail, and the results of measurements of the quantum efficiency of scintillators containing Pb, Hg, or Sn are given. Orig. art. has: 4 tables.

stably at all power levels including the maximum (90 MW). The total icebreaker power of 44,000 hp was provided by three reactors operating simultaneously at 65 MW each. Each reactor produced 360 tons steam per hour at 28 kg/cm² and 300--310C. The operational and neutron-physics characteristics of the reactors, the procedures used to reload the reactors, and the training of personnel are described in some detail. It is concluded that the atomic equipment of the icebreaker operated satisfactorily in all respects. "The experimental neutron-physics characteristics of the active zones of the reactors were obtained by the co-workers N. A. Lazukova and A. K. Sledzyuka." Orig. art. has: 10 figures.

TITLE: New method of determining damping coefficients for air dampers and liquid
dampers of electric measuring instruments

SOURCE: Przeglad elektrotechniczny, no. 3, 1966, 89-90

TOPIC TAGS: vibration damping, electric measuring instrument, ~~air damper~~,
~~liquid damper~~

ABSTRACT: A new formula of calculating the damping coefficients for air dampers
and liquid dampers of electric measuring instruments (derived from a formula worked
out by Dr. J. Chalecki) has been introduced and described. Results of using the
new formula were compared with results obtained when using other formulas. Draw-

ORG: GrozNII

TITLE: Mono- and dimethylformamide: solvents for low-molecular-weight aromatic hydrocarbons

SOURCE: Khimiya i tekhnologiya topliv i masel, no. 5, 1966, 13-16

TOPIC TAGS: aromatic hydrocarbon, solvent extraction, methylformamide, dimethylformamide

ABSTRACT: A study has been made of the extraction of aromatic hydrocarbons from their 1/1 mixtures (by weight) with diphanic hydrocarbons with N-methyl- or N,N-dimethylformamide. The experiments were conducted at 20°C with such systems as benzene-hexane (cyclohexane), toluene-heptane, o-xylene-octane, or isopropylbenzene-nonane. Mixtures of formamides with water (2-25%) were used as extractants. The ratio solvent/hydrocarbon was 1/1. It was shown that: 1) mono- and dimethylformamide are better solvents of aromatic hydrocarbons than di- and triethylene glycols; 2) with increasing water content the selectivity of the formamides increases but their solvent action decreases; 3) under identical conditions mono- and dimethylformamide exhibit equal selectivity; 4) the selectivity of formamides in the extractions of aromatic hydrocarbons is higher for mixtures with paraffins than

L 26119-66

ACC NR: AP6015113

with naphthenes; 5) the selectivity of monomethylformamide is independent of the molecular weight of the aromatic hydrocarbons to be extracted; the selectivity of dimethylformamide improves with an increase in the molecular weight of the mixture. [BO]

TITLE: Dehydration of diols derived from 2,3-cyclohexano-bicyclo-[3.3.1]-nonane

SOURCE: Rovista de chimie, v. 16, no. 2, 1965, 76-80

TOPIC TAGS: condensation reaction, aldehyde, IR spectrum, UV spectrum, aromatic hydrocarbon, dehydration

ABSTRACT: The authors studied the conditions as well as the reduction mechanism of the carbonyl groups of some tricyclic ketols resulting from the condensation of aldehydes with cyclohexanone. They synthesized condensed cyclic hydrocarbons and were able to clarify some theoretical questions relating to ketonic condensation and ketol dehydration reactions. Infra-red and ultra-violet spectral analysis was used in the study. Orig. art. has: 6 figures and 4 tables. [Based on author's Eng. abst.] [JPRS]

"Resochine in the Treatment of Chronic Erythematodes and Psoriasis."

Warsaw, Polski Tygodnik Lekarski, Vol 13, No 26, 24 Jun 63,
pp 942-944

Abstract: [Authors' English summary modified] In view of the lack of a satisfactory treatment for chronic erythematodes and for psoriasis, the authors investigated the effect of resochine on the two skin diseases. They give details of their findings, concluding that resochine is the most effective drug for chronic erythematodes, with sustained treatment to prevent relapses. Their findings with respect to psoriasis were inconclusive, and think that further studies are needed to obtain better data. There are 16 references: 1 Soviet, 4 Polish, 3 German, and 3 Western.

Photochemical reactions of carbonyl cyanide. Wiktior Kęsiuk and Kazimierz Lech Wierzchowski (Univ. Warsaw). Roczniki Chemii 27, 527-8 (1963) (English summary). — The absorption spectrum of carbonyl cyanide in the ultraviolet consists of 2 bands: one of electronic absorption from 2390 Å, toward shorter waves and the 2nd, from 3600 Å, to 2570 Å., a band spectrum of predissociation type (cf. preceding abstr.). Both regions are active photochemically. The primary photochemical process splits the mol. of $\text{CO}(\text{CN})_2 + h\nu \rightarrow \text{CO} + 2\text{CN}$. In agreement with Hogme and Tsai (C.A. 26, 1191) the CN radicals polymerize to $(\text{CN})_x$, so that the photochemical reaction can be expressed: $x\text{CO}(\text{CN})_2 + nh\nu \rightarrow x\text{CO} + (\text{CN})_x$. — Sylvia Nowinska

Title : Prevention of Fruit from Floating in Stewed
Fruit.

Orig Pub: Przetwor. owoc.-warz. i koncentr., 1958,
2, No 1, 6 - 8.

Abstract: In order to prevent fruit from floating, air
is removed from them before they are filled up.
It is found that a 2 min. treatment of fruit
under the pressure of 130 or less mm eliminates
the floating. An appliance producing 3
tons of strawberries or 5 tons of stewed fruit
in 8 hours is described.

TITLE	: A Comparison of Hot and Cold Processes for the Extraction of Juices from Pigmented Fruits	
ORIG. PUB.	: Przetwor Owoc-Warz i Koncentr. 2, No 3, 66-91 (1958)	
ABSTRACT	: The hot extraction process when combined with fermentative depectinization is more effective than the cold process. The hot process is based on the heating of the fruits to 30-35°, partial cooling to 40-45°, treatment with an enzyme preparation, and separation of the juice in a hydraulic press. The method is not suited for application to strawberries and raspberries, which lose volatile aromatic substances on heating.

652. LOCATION OF FAILURES DURING SURGE TESTING
OF TRANSFORMERS. W. Lech.

Arch. elektrotech. (Warsaw), Vol. 3, No. 3, 243-60 (1954).
In Polish with summary (2 pp.) in English.

A method termed the secondary current method is described. In it the voltage across a resistance connected between the terminals of the secondary winding is recorded, the tank and the ends of both windings being earthed. The applications of the method to a 1-ph. 110/6.3 kV., 10 MVA model transformer and a 30/0.1 kV potential transformer are illustrated by oscillograms obtained with the aid of the recurrent-surge oscillograph. Another set of oscillograms is given corresponding to the same faults but obtained using the line-current method due to Stenkvist. The analysis of the two sets of oscillograms shows that the secondary current method gives more accurate results; if supplemented by a t.v. measurement of the surge voltage distribution it becomes satisfactory even for cases when the wave character of the recorded surges is badly defined and uncertain.

✓ 4212. The recurrent-surge oscillograph and its
application for investigations on transformers. W.
LECH, Przeglad elektrotech., 31, No. 2-3, 64-72 (1955) *EE*

In Polish.

A description of the design and operation of the
instrument together with a discussion on its accuracy
for impulse voltage measurements on transformers.
An investigation into errors due to oscillograph input
capacitance carried out on two different transformers
(30 kV, 100 kVA and 110 kV, 31.5 MVA) indicates
that the max. overall error should not, in general,
exceed 9% for small and 5% for large transformers.
A number of applications of the recurrent-surge
oscillograph other than testing transformers is also
mentioned.

190 "Odlewne zlepy magnazu ze złomu". Przegląd Odlewictwa, No. 7, 1958 (Bil. Inf. Inst. Odlew.) pp. 14-18, 4 tabs.

The problem of utilizing scrap magnesium alloys in the manufacture of castings for non-military purposes. The object of this investigation was to find methods for the treatment of existing reserves of scrap for producing the alloys in pigs, and, in relation to such reserves, to define production possibilities as affecting both quality and quantity. The investigation was based on the Soviet standard specification GOST 2336-45. The best results were achieved with the ME4 alloy which can be obtained, when the composition of the charge is chosen correctly, by once melting scrap No. 3305, and by twice melting unmarked scrap and such as is marked with numbers 3304, 3506, 3510 and 3520. To prepare scrap for melting, it must be cleaned of non-metallic impurities (sand) and all metallic parts (reinforcements, screws, etc.) must be removed.
